Therapeutic Honey, on Demand

We have always known that natural honey produced by bees is healthy for humans. In common medicine, it is believed to have healing abilities. But Dr. Alexander Goroshit, doctor and microbiologist from Israel, went one step further; in his factory-controlled beehives, the bees produce honey on demand! The main idea is controlled feeding of the bees with special therapeutic plants based on a formula prepared in advance. The resulting honey produced by the bees is much stronger than the formula ingredients on their own. Dr. Goroshit remarks, "A synergetic process is performed which intensifies the properties of the active substances and leads to very strong effects"

The resulting honey produced by the bees is much stronger than the formula ingredients on their own.

In a research study, Life Mel proved to be effective for cancer patients undertaking chemotherapy. Professor Jamal Zidan, who took part in the Life Mel clinical test, confirms the honey succeeded in preventing a decrease in blood cell count, a known and perilous side effect for many patients. Honey, no doubt, is a healthy food,

but most of us use it as a sweetener. For Ms. Ana (name changed) from Israel, the honey became much more than that. It literally sweetened her life, which changed three years ago when she was diagnosed with cancer. The surgery was relatively straightforward, but the hard phase came afterwards, when she had to go through chemotherapy. Harsh side effects included a drastic decrease in her haemoglobin and blood count. "I felt terrible weakness, I was on the edge, I could not function. My haemoglobin and white blood cell counts continuously dropped and my immune system was weakened. I reached a state where my next course of chemotherapy was delayed, since the doctors were afraid I could not stand it..."

In one of her hospital visits, Ms. Ana met a fellow patient who told her about a new product that was "doing wonders" to prevent harsh side effects. "I told her that I didn't believe in alternative products. I heard enough stories of healers taking advantage of the misery of patients. But she told me that the product was a special medicinal honey checked in a clinical test in the hospital in Zfat, and as it was only honey, it couldn't hurt", says Ms. Ana. "She convinced me that it was worth a try." Before the next chemotherapy, Ms. Ana started taking Life Mel. "The effect was amazing, just

amazing. After five days, my leukocytes (white blood cells) increased and the haemoglobin even increased a bit. I felt strong and could function, I could even go to work! And I was still not sure it was due to the honey, so for the next round of chemotherapy I did not take the honey. I had such a decrease, worse than before. Once I started retaking the honey the side effects almost disappeared."

Factory for Medicine:

Manufactured honey to cure cancer?

It sounds like a fantasy, but before we learned about how the honey is developed, Dr. Alexander Goroshit, the inventor of Life Mel, carefully clarified this statement. "The honey I developed does not cure cancer! It has a positive effect on harsh side effects, and that alone is a lot! It helps to prevent neutropenia, hence a decrease in blood counts, white blood cells, platelets, and haemoglobin levels, which often result from chemotherapy. It works to strengthen the immune system and improve the quality of life of the patient"

What was the development based on? What makes Life Mel special?

The simplicity of the answer is surprising. The idea is to feed the bees with special nectar made from a blend of therapeutic plants and natural honey. Feeding the bees with a controlled formula and dosage is

designed to treat specific medical problems. The outcome is a totally natural honey with medicinal properties. For the production of Life Mel the bees are fed with herbs such as Siberian Ginseng, Echinacea, Uncaria and other plants, as well as natural bio active materials, such as iron, protein, enzymes and vitamins. The active ingredients in Life Mel are absorbed directly in the blood.

Why not provide the blend directly to the patient? What is the difference?

Dr. Goroshit: "In the bee's body there is a synergetic process which intensifies the properties of the active substances. Science cannot yet utterly explain the mystery of the bee - how some active substances change into other substances - but what is known today is that the bees process the special blend and produce a honey that combines medicinal properties and excels with a strong effect.

We sent the honey to a leading laboratory in the USA to be checked, and they were amazed by the sum and intensity of active substances in the product. This is the reason why Life Mel affects people within five to ten days!"

The start of Life Mel was no honeymoon

Dr. Goroshit, a conventional doctor, was exposed to the medicinal honey mystery during the seventies. Back then he was a young intern who worked at the Department of Infective Viruses in Tashkent and was urged to treat an outburst epidemic of cholera in a rural community.

"When we mapped the morbidity, we noticed there were two centers clean from cholera. I visited those centres and found out they were settled with beekeepers on a predominately beehive-based diet. I extended my research and found out that the bees were nourished from specific plants. Through that I came up with the idea that one could nourish the bees with special blends – and end up with a medicinal honey!"

Dr. Goroshit in the lab.

In the nineties, when Gorbachev opened the Iron Curtain, Goroshit decided to immigrate to Israel. "I came as a new immigrant, but instead of practicing medicine I decided to realize my idea. I requested funds from the government and got initial support as part of a technological greenhouse program. I started working on medicinal honey production".

One of the conditions of the government to continue and support the project was that the product would undergo an external laboratory test to prove that it was as effective as antibiotics. "After five months we had the laboratory reports determining that the honey was even more effective than antibiotics in treating throat infection, diarrhea and more". As a result, the government continued to support the research and development.

The logic behind the project, says Goroshit, was to feed the bees with active blends from therapeutic plants that the bee would not be able to reach naturally – for example, active substances that exist in leaves and roots and not just in nectar. Dr. Goroshit developed different blends

and created different products – some with antibiotic properties for specific disease, while some for general medical purposes. The formula used in Life Mel contains substances which are intended to prevent reductions in blood count and anemia and to improve the functionality of the immune system.

Prevented anemia in more than 60% of patients

The medicinal honey of Dr. Goroshit, was given to patients from Kiryat Shmona. Quickly the word spread about a product that “causes patients to react on chemotherapy as if it was water.” There was significant interest from oncologists who observed their patients’ results.

Prof. Jamal Zidan, head of the oncology unit in the Sieff Medical Centre in Zfat, heard about the product from patients and decided to scientifically test it. “One of the problems common to cancer patients, is all sort of alternative products and treatments based on rumors, and unproved stories. On the other hand, honey is known to strengthen the immune system, and in

any case it is a food supplement and cannot hurt. That led me to the decision to check out Life Mel.”

Prof. Zidan started a controlled clinical test that included chemotherapy patients. “With most chemotherapy patients we observe a reduction in blood counts and the immune system during the treatment phase. They also weaken and are more exposed to other infectious diseases. When the blood count drops, you need to increase it with injections. We decided to check whether the honey would be effective in easing harsh side effects and whether the honey would prevent the need for injections.”

The clinical test was performed by a team of senior oncologists and geneticists. The research lasted over two years, and included thirty cancer patients who were going through chemotherapy and suffering from severe neutropenia – reductions in white and red blood cell counts, thrombocytopenia and hemoglobin levels. The patients received the honey with their treatments. The results, published in the medical

journal “Medical Oncology”, showed success:

In 40% of the patients there was no decrease of blood count and in 64% of the patients there was no decrease of hemoglobin.

The honey was found to be effective in decreasing the incidence of anemia in over 60% of the patients.

32% reported an improvement in quality of life!
